**DETAILED ACTION**

1. Claims 1-21 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by Balaban et al. (4,464,675).

Balaban et al. discloses in figures 1, 2a and 2b, a filter (20) clearly including a shift register having a plurality of register (LI, TI1-TI227) coupled in cascade controlled by a synchronization clock (IFC), and an arithmetic subtracting unit having an inverter (72) and an adder (74) for obtaining a difference between an input data stored in the output end (TI227) and the input end (LI) of the shift register to form an output of the filter as claimed. As illustrated in figure 12d, the filter clearly has a function of a band pass filter that extracts a desired frequency band ( $15,734/2 = 7867\text{Hz}$ , the frequency at the center of the of the first tooth) from an input signal, and thus the data of the input signal within the desired band. The length of the shift register (LI+TI1 to TI227 = 228) is clearly equal to the sum of 1 and an integer part (227) of a ratio ( $1.79\text{MHz}/7867\text{Hz} = 227.7$ ) of a half of a signal sampling rate (IFC = 3.58 MHz, see col. 4, lines 64-65) of the input signal to a desired band pass frequency ( $15,734/2\text{ Hz}$ , see figure 12d and col. 12, lines 64-68) as claimed.

2. Applicant's arguments filed on 01/02/2007 have been fully considered but they are not persuasive because the comb filter 20 of Balaban et al. as clearly explained above have a function as a band pass filter as claimed. It should be noted that the filter of the present invention is also a comb filter with the teeth, as illustrated by figure 4 showing the first two teeth, separated by  $2 \times 1.25\text{KHz} = 25\text{KHz}$ .
